

Cancer - What Every Person Needs to Know

Cancer is the third leading cause of death in the US, with over 500,000 people dying every year from cancer, and most cancer is 100% curable. I say the medical symptoms and disease care system is responsible for these deaths as well. Here is why:

The reason why you do not have all these proven natural therapies everywhere helping people heal themselves and get rid of the cancer is because of the medical symptoms and disease care system and their magic veil of protection. If they treat someone with chemo, surgery and radiation and the person dies, they say it was just the cancer. If you treat someone with anything else instead of the current “reasonable and customary” methods and the person dies, you will get sued and probably lose, even though the survival rate for getting medical symptoms and disease care treatment for cancer in the US is only about 50% overall.

Insanity is doing the same thing over and over again, and expecting a different result. If you do the same thing, you can expect the same result.

For over 30 years, Medicine has been trying the same thing, surgery, chemo and radiation to cure cancer. And 30 years later, they still have no cure. They have better surgery procedures, they have different chemotherapy agents, they have different machines for radiation, but they are still doing the same thing. It is like a fly hitting its head on the window, as it is trying to fly out the window. It comes at it from different angles. It comes at the window faster and slower. It takes a break. The fly may even try another window. But yet, it still doesn't get out. Why? It is doing the same thing over and over again. Yes, it is slightly different, but overall, it is the same thing.

Back then, medical symptom and disease care also thought the body was a machine. Like a clock, with no internal wisdom, nothing guiding it other than the Genes. So if the human body or “machine” screwed up, they had to fix it. If you “got” cancer, the medical symptom and disease care had to fix you. Like when your car breaks down. Your car does not fix itself, you must have someone fix it. So the tumor was this “thing” and it would make sense, that if you just cut out the tumor, things might get better, because the tumor was gone. And from their knowledge and perspective at the time, that made total sense.

One thing that needs to be remembered is that at one time chemotherapy, radiation, and surgery were not reasonable and customary either. They were new and unproven. Now, here is the interesting part. Chemotherapy, radiation, and surgery initially started being used based solely on an idea, a theory. You see, the medical symptom and disease care system had no other form of treatment for cancer, so these techniques were the only thing that was available, and they made some sense based on what knowledge they had at that time. No one double-blind study. They didn't do double-blind studies to compare chemo/radiation/surgery to other things, to prove it to be the most effective. Doctors started using these methods with only some case studies and a theory. And, by the way, the theory was based on Newtonian physics, which at that time had “only” been proven wrong 40 years ago.

Research shows that cancer cells grew quicker, and divided quicker, than normal cells. The medical community thought, Well, radiation kills cells that are dividing. The

Cancer - What Every Person Needs to Know

same thing with chemotherapy. It is a drug that kills ALL cells that are dividing. So since cancer cells divide quicker, they thought that radiation and chemotherapy might help kill more cancer cells than regular cells. And, in theory, it sounds great. Kill all the cells that are dividing. Cancer cells divide quicker, so they will likely die quicker. Yes, your body will have casualties of war. Other cells that are dividing will also die. But it will be best for the whole (so the theory went).

Doctors did that for a while, because they knew of nothing better to fight cancer with, and then it became reasonable and customary. Interestingly, no studies were done, no research. Doctors just did it because they had no other options. Nowadays, the studies they do have are case studies, or double-blind studies comparing one form of chemo to another or one form of radiation to another. They still have no double-blind studies proving chemo is better than any of the other ways of helping cancer heal. No double-blind studies that they think everyone else should do.

It is 40 years later, 30 years since the official “war on cancer” was declared, and we are still losing miserably. No known cures, nothing. The only thing the medical profession is saying is that we are getting better at curing people. They say this because statistics indicate that the survival rate is going up. Now, that is interesting. The survival rate is going up. What does that actually mean?

The only thing the AMA can state is that the survival rate is going up. You would think that this means more people are cured of cancer completely, and living a healthy normal life again, right? Wrong. The survival rate is the number of people who are alive five years after the time of diagnosis. Does this mean that people are living longer? That more people are cured than before? Or does this just mean that the diagnosis and detection of cancer is getting better?

Let me explain. Let's say a person starts developing a tumor. In one year, untreated, it is 1 cm in size. In two years, 2 cm in size, and after two years the person finally gets symptoms, obvious to anyone, that there is something wrong. So that person goes to the doctor, the doctor does some tests, and finds out that there is cancer. The patient goes through treatment and, four years, 364 days after the original diagnosis, the person is dead. The patient is not a cancer survivor. If that person had lived only one more day and then died, they would have been a cancer survivor. That is not even my point, but it is an interesting one. This person is dead six years and 364 days after the tumor started.

Now let's say that same person went to the doctor for a routine check-up a year earlier. This check-up included screening for the type of cancer they had. The doctor found the cancer early, and the person begin treatment. Five years and one day later, the person is still living. They are now a cancer survivor. This person who, if they had waited one year longer to visit the doctor, would now probably not be a cancer survivor. It is now only six years from when the tumor started. In the above scenario, the person lived six years and 364 days. But even if they die 364 days later from the cancer, they are still a cancer survivor. In both scenarios the person was alive for six years and 364 days. In one

Cancer - What Every Person Needs to Know

the person is a survivor, in the other they are not. The only difference is that the diagnosis was made earlier in the “survivor’s” case, even though the cancer still killed them.

Everyone knows, and the medical profession seems so eager to tell us, that early detection is the key for treatment. Why? Because the survival rates are better if the cancer is detected early. The medical profession says this over and over again. They are getting great at early detection.

What I am saying is, I think the treatment does nothing to help people live longer. That, statistically, the reason survival rates are going up is because the medical profession is getting better at detecting cancer earlier. Since they detect the cancer earlier, the person has longer before the natural progression, if left unchanged, leads them to death. And that earlier detection time gets people pushed over the five-year mark to make them cancer survivors, even if they die from the cancer one day after the five-year mark from the date of diagnosis.

Cancer is looked at as this elusive thing, when in all actuality, it is something that happens every day in every person. You develop one million cancer cells in your body every day. And, every day, your body kills one million cancer cells.

What is cancer? Cancer is not a tumor. A tumor is the name given to a group of cancer cells. Cancer cells are mutated cells. And every day you develop about one million mutated cells in your body. And every day of your life, your body gets rid of those cancer cells. Even if you have a tumor, up until you got that tumor, every day of your life, your body developed one million cancer cells, and every day, your body got rid of them.

Your body is so amazing. Every second you produce 50 million new cells. Every second your body makes 50 million new cells. Every second your body rips apart the genetic code in 50 million cells. Every second it duplicates 50 million cells. Every second. Now, in that process, with SOOO many cells being made in one day, there is bound to be an error here and there. Imagine copying 50 million pieces of paper every second. Do you think you might make an error or two, or a million? Exactly. As your body creates 50 million new cells each second, there are some errors. And these errors are cancer cells. Your body created a system to deal with this, because it knows errors happen. So your immune system works every day to kill off these cancer cells.

What happens when you get a tumor is that your body does not kill off these cells that have divided wrong. Your body, for whatever reason, lets them grow. Most cells that are mutated grow and divide quicker than normal cells, so the damaged cells begin to grow and divide. And then you develop a tumor big enough to create medical symptoms and for the disease care system to detect and diagnose.

Now, wouldn’t it make more sense to fix the reason why your body quit killing the mutated cells? What happened? Why did your body quit doing something it had done a million times each day for your entire life?

Better yet, if you got your body to start killing those mutated cells, those cancer cells, it wouldn’t matter why it quit. Maybe why might make a difference to keep it from happening in the future, but it wouldn’t matter now. Your body would be killing the

Cancer - What Every Person Needs to Know

cancer cells, and without any surgery, radiation, or chemotherapy, your body would heal itself, just as your body has done a million times a day in the past. But the question of why your body stopped killing these mutated cells is not addressed by the medical symptoms and disease care system.

In fact, your body's killing cancer cells is what the medical symptoms and disease care system ends up relying upon in the end. The medical system just looks at getting the cancer out, and who cares about why you stopped killing these cells yourself? They do their chemo, radiation and/or surgery and then, at the very end, they rely upon your inner wisdom. They hope that your body is able to get rid of any cancer cells that might be left.

The following idea is my theory, which is really no different than what the medical profession has, because they only have a theory as well. The only difference is that more people subscribe to their theory. Popular opinion is no measure of validity, because at one point in America it was popular opinion that burning people at the stake was a good idea.

Cancer does not metastasize and spread. Cancer does not pick up its bags, and travel somewhere and find a new home. You hear the doctors say, "We have to get it early before it metastasizes." Here is my theory:

This pulls back from the previous chapter about how your DNA does not cause you illness. There is part of your DNA that is constructively, with intent, mutating itself to try to better deal with the perceived environment. Every cell has the DNA needed to make any cell that is within your body and, at any one time, 50 million cells are mutating. So when cells mutate specifically with intent, they do so in more than one place. If one of these mutations that happened in multiple places doesn't end up serving the body, the body usually gets rid of these cells.

But if, for some reason, the body does not recognize the cancer cell as cancer, it will not get rid of the cells, and the body will not get rid of those mutated cells anywhere they are in the body. If these cells are left to grow, the body has a different blood supply, oxygen supply, and all sorts of other factors that are different in all the different parts of the body, so of course the cells will grow at different rates, and the tumor, or group of cancer cells, will show up in some places before others. If this continues, eventually you will see tumors in other parts of the body. They all started at the same time. No one moved or metastasized. That is why tumors can often seem to be of the same origin.

I am not saying no cancer metastasizes. I think some do. The body's lymph system is like a sewer system; its job is to filter out all the garbage, including cancer cells, from the lymph. Then your immune system has a concentrated place from which to launch its attack. This is very efficient. But sometimes the cancer cells can grow in these lymph nodes, wherever they are in the body.

This to me is also the reason why in so many people the cancer comes back later. The doctors never really dealt with why the body was not killing the cancer cells in the first place. They just focused on getting rid of the cancer.

If you have a plumbing leak and the bathroom floor is flooding with water, do you just keep mopping up the water, or do you find out why the water is on the floor and fix

Cancer - What Every Person Needs to Know

that? If the body is not getting rid of cancer cells, you are developing cancer cells in your body. Do you just keep killing the cancer cells, or do you look at why your body quit killing those cancer cells? After 30 years, the medical system still does not look for the reason why.

I know many natural health care practitioners who are helping 80-90% of the people they see heal themselves of cancer, and this is usually with people the medical symptoms and disease care system has given up on. I think the numbers would be even better if natural practitioners got the “easy” cases as well.

This is why I say the medical symptoms and disease care system is responsible for most of the 500,000 deaths each year from cancer. They are withholding appropriate health care that has been proven more effective. They are using methods that are 30 years old, which have pretty much never been tested, and especially have never been tested in the way the medical community expects others to test their form of cancer treatment.

So what can you do to help your body heal when you expressing symptoms of cancer? There are two huge things that have shown to be very beneficial that you can add to anything you are already doing.

The biggest one is adding to your level of health. Doing what it takes to increase the level of health in your bucket. If you don't know exactly what this means, read my book, “The Creator's Manual for Your Body”.

The other is an herb/tea mixture called Essiac. It is a specific combination of herbs that you make into a tea and drink. It has produced miracles for people who have had no other hope. There is a book called “Essiac – The Secrets of Rene Caisse's Herbal Pharmacy” by Sheila snow and Mali Klein. You can buy Essiac for unreasonable amounts of money on the internet, and with a little bit of time, you can make it yourself for really, really cheap. This book will tell you how.

Anything that helps your immune system can also benefit you. Mainly because it is your immune system that gets rid of the cancer cells on a day-to-day basis. So if your immune system is working better, so will your body's ability to get rid of cancer cells.

So remember, cancer is not everything your medical doctor necessarily says it is. Follow your inner knowing and do what your inner knowing tells you to do.
